

UNDERSTANDING PASSWORD MISTAKES

Hackers are constantly coming up with ways to infiltrate systems.

One of the most common ways is using password cracking software. The easier the password the faster they gain access!

Using the same password for everything (from social media accounts, to banking accounts), because it is easier to remember, is also extremely dangerous and the fastest route to disaster.

Imagine someone has cracked your password and you use this password for everything, you've basically given them the key to the kingdom!

Having the strongest password in the world, will not matter if you've shared it with someone. You have no control over how this person decides to store it or use it.

Avoid these common mistakes and create a better cyber hygiene, your wallet and peace of mind are worth it!
